Merging

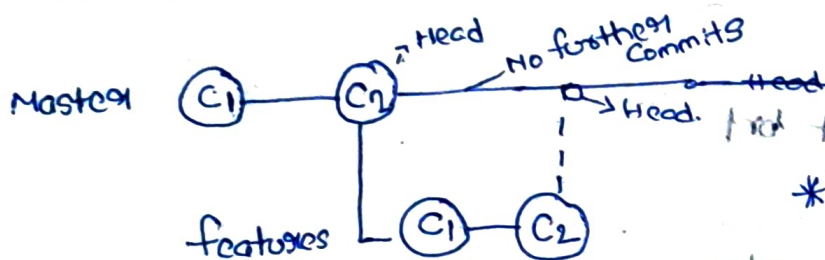

→ Git merging means combining the changes from one branch into another branch

Two Types of merging:-

1) Fast-forward merge:-

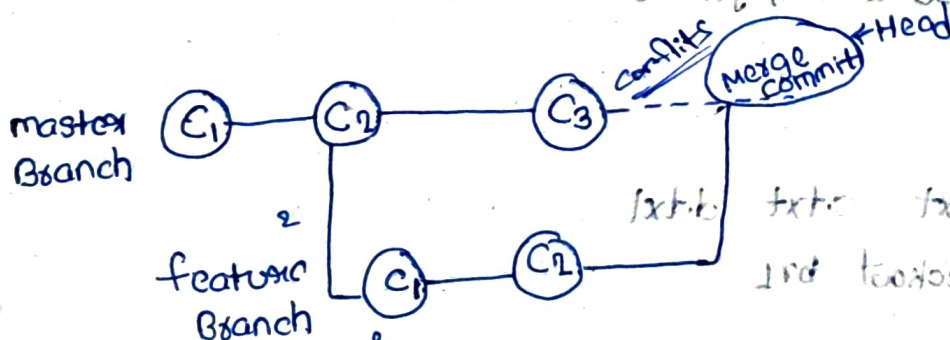

→ fast-forward merging means Git simply moves the main branch pointer forward to the last commit because there are no new commits on the main branch.

* changes happen in the child branch only.

2) Three-way Merge:-

→ Three-way merge means Git takes changes from two branches and combines them using their common starting point.

* changes happened in parent & child branches.

* so there is chance of conflicts.
